Read the following passage and answer the questions given after it

The ancient temple of Kom Ombo, 400 miles south of Cairo, where archaeologists recently unearthed stack of decaying mummies is facing an unusual peril: waterlogged foundations.

Decades of flood irrigation in the surrounding fields, which were once desert, have soaked the soil beneath the temple. Water has penetrated the sandstone foundations, combining with salt and heat to scrub some hieroglyphs from the temple walls. The symbols and figures, effectively the lines of an ancient story, are fading to dust.

The solution, according to engineers working on a \$9 million American-financed project, is some modern drainage. Since October 2017, dozens of laborers have been digging a 30-foot-deep trench around the temple walls in an effort to drain the groundwater and divert it back into the Nile.

Unusually, a team of archaeologists is working alongside the laborers, hoping to save any treasures that are uncovered in the dig. It has found significant objects, including a bust of Marcus Aurelius, an Old Kingdom pottery workshop and a relief of Sobek, the crocodile god of the temple. On a searing July afternoon, one archaeologist held forth an ancient lunch: a fistful of charred, 4,000-year-old grains of wheat, discovered in an excavated urn.

The most exciting discovery may have been in recent weeks, when archaeologists pulled a sand-encrusted sphinx from a damp hole. It has been dated to the Ptolemaic era, which ran from 305 B.C. to 30 B.C.

At less than two feet tall, the sphinx is a dwarf compared with the famed Great Sphinx of Giza, which rises to 65 feet and stretches 240 feet from head to tail. It also had a broken paw and no identifying markings.

But unlike the Giza sphinx, whose features are badly eroded by time and the elements, the Kom Ombo sphinx is finely preserved — as is the sense of its mythic power: a man's head on a lion's body.

The water troubles at Kom Ombo, and at many other Pharaonic sites along the Nile, are a product of one of Egypt's proudest successes.

The massive Aswan High Dam, 30 miles upstream from Kom Ombo, transformed Egyptian agriculture when it was completed in 1971. Having tamed the ancient cycle of flood and drought, Egyptians could cultivate up to the river's edge, helping make their land some of the most productive on earth.

In the decades since, though, the unwanted side effects of the Aswan Dam have become gradually more apparent. In some parts of the fertile Nile Delta, the dam has caused increased salinity, forcing farmers to switch crops or abandon fields entirely. And the Pharaonic temples lining the river have also suffered.

The work at Kom Ombo is one of six major groundwaterlowering projects financed by the United States in Egypt, at a cost of \$100 million, since the 1990s. Previous efforts have focused on the Pyramids of Giza, the catacombs of Alexandria and Cairo's old city.
